Question 7

If x and y are given in terms of a parameter t by $x = e^{2t} + t$ and $y = t - \ln t$, find $\dfrac{dy}{dx}$.

We have $\frac{dx}{dt} = 2e^{2t} + 1$ and $\frac{dy}{dt} = 1 - 1/t$.

Hence $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{1-1/t}{2e^{2t}+1} = \frac{t-1}{t(2e^{2t}+1)}$.
